

A Identity simplification reclassifies exposure

Exact identity versus same-class/window administration

A1 (n=20,248)

Positive Jaccard = 0.448

A2 (n=2,813)

Positive Jaccard = 0.595

both positive same-class only both negative

Construct measurability is independent of reclassification

A1 route: order 9,940 / 9,940 available; eMAR 0 / 87,569.

Same-class/window is a prespecified ablation, not a replacement definition.

B Operator changes propagate selectively to paired estimates

Identical cohort, outcome, and covariates within each published-style pair

A1

A1 · exact identity

|Δ log| 0.044

A1 · same class/window

|Δ log| 0.723

A2

A2 · original exact identity

|Δ log| 0.012

A2 · original same class/window

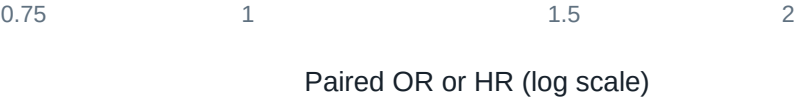

|Δ log| 0.455

A2 · hospital-overlap exact identity

|Δ log| 0.159

A2 · hospital-overlap same class/window

|Δ log| 0.308

order-defined administration-defined

Measurement stress tests only; estimates are not causal drug effects.
